Who We Are

With a team of leading geneticists, researchers, lab technicians and 20+ PhDs plus 40+ staff members, working together to innovate in genetics and data analysis, we conduct research using the latest equipment and cutting-edge science. Our clients, including healthcare organizations and individual clinical practitioners, gain useful information about their patient's unique genetic makeup that they can use to personalize their care and help improve their lives and make better and more informed health & lifestyle choices.

Why Partner With Us

The panels we develop are novel, and do not currently exist in the market. With unique and proprietary genetic tests and panels that are developed – and performed – in our own labs, Ai Genetics not only controls the process, we are also committed to keeping costs down. Clinical practitioners and healthcare organizations can fill the void in current genetic testing with useful information about clients and their genetic health, all provided at an affordable cost.

Our Mission & Vision

Our mission is to empower individuals and optimize human health through genetic testing and AI technology through the expertise of our team and our partners.

Our vision is to realize a future in healthcare that is patient-centred, personalized, participatory and preventative.
